

# Cormen Exercises I.2.1

September 2018

José Daniel Organista Calderón

## Exercises

### 2.1-1

Using Figure 2.2 as a model, illustrate the operation of INSERTION-SORT on the array  $A = \{31, 41, 59, 26, 41, 58\}$ .

### 2.1-2

Rewrite the INSERTION-SORT procedure to sort into nonincreasing instead of nondecreasing order.

```
INSERTION-SORT(A)
1 for j = 2 to A.length
2   key = A[j]
3   i = j - 1
4   while i > 0 and A[i] > key
5     A[i + 1] = A[i]
6     i = i - 1
7   A[i + 1] = key
```

### 2.1-3

Consider the *searching problem*:

**Input:** A sequence of  $n$  numbers  $A = \{a_1, a_2, \dots, a_n\}$  and a value  $v$ .

**Output:** An index  $i$  such that  $v = A[i]$  or the special value NIL if  $v$  does not appear in  $A$ .

Write pseudocode for linear search, which scans through the sequence, looking for  $v$ . Using a loop invariant, prove that your algorithm is correct. Make sure that your loop invariant fulfills the three necessary properties.

Pseudocódigo  
LinearSearch( $A, v$ )  
1  $i = \text{NIL}$   
2 **for**  $j = 1$  **to**  $A.\text{length}$   
3   **if**  $A[j] = v$  **then**  
4      $i = j$   
5     **break**  
6 **return**  $i$

Tenemos como invariante que no existe un índice  $k$  menor a  $j$  tal que  $A[k]=v$  por cada iteración en el loop. Si en un caso se llega a cumplir que  $A[j] = v$  el ciclo retorna  $i$  y se cumple la invariante dado que  $j$  es mayor a  $k$  y no existe un índice  $k$  menor a  $j$  tal que  $A[k]=v$ . En caso contrario se realizan todas las comparaciones entre  $A[j]$  con  $v$  se termina el loop y se retorna  $i$  que ha sido inicializado con NIL. La invariante se conserva, dado que en ningún punto existió un  $k$  menor a  $j$  tal que  $A[k] = v$

#### 2.1-4

Consider the problem of adding two  $n$ -bit binary integers, stored in two  $n$ -element arrays  $A$  and  $B$ . The sum of the two integers should be stored in binary form in an  $(n+1)$  element array  $C$ . State the problem formally and write pseudocode for adding the two integers.

Pseudocódigo

**Input:**  $A, B$  arreglos de tamaño  $n$

**Output:**  $C$ , un arreglo de tamaño  $(n + 1)$  con la suma de  $A$  y  $B$

addingBinary( $A, B$ )  
1  $C = [], \text{carry} = 0$   
2 **for**  $i = n$  **to**  $1$   
2    $C[i+1] = (A[i] + B[i] + \text{carry})$   
3   **if**  $(C[i+1]) \geq 2$  **then**  
4      $\text{carry} = 1$   
5   **else**  
6      $\text{carry} = 0$   
7    $C[i+1] = (C[i+1]) \bmod 2$   
8  $C[1] = \text{carry}$

```
9  return C
```
